

ABSTRACT OF THE DISCLOSURE

A three-dimensional molded breast pad for a brassiere is provided. The molded breast pad has a cup shape with at least
5 one or more first layers of a first material and one or more second layers of a second material. The first and second layers/materials have different loft characteristics associated therewith. These loft characteristics influence, at least in part, the elastomeric properties of the first and second
10 layers/materials. Thus, the molded breast pad is a moldable three-dimensional breast pad cooperative with a brassiere to support, shape and/or smooth the contours of a wearer's breast.
